7 2 Letter to the editor: "Revolutionizing Clinical Education: Opportunities and Challenges of AI
8
9 3 Integration"

10
11
12 4 The integration of artificial intelligence (AI) into clinical practice has the potential to
13
14 5 significantly impact the way in which physiotherapists within the multidisciplinary team
15
16 6 (MDT) are trained and the care they provide to patients. This letter will explore the current
17
18 7 and potential implications of AI on clinical education.
19
20
21

22
23 8 Within healthcare, Moreno-Fergusson et al. (2021) noted that the use of AI-powered
24
25 9 prescriptive and predictive analytics can enhance inpatient care management and decrease
26
27 10 the workload of nurses. Zhou et al. (2022) implemented an AI-based standardized electronic
28
29 11 handover system with significant potential to enhance paediatric patient safety and improve
30
31 12 the handover process. Seibert et al. (2021) also observed that AI has the potential to
32
33 13 support healthcare by assisting in the assessment, diagnosis, and prognosis of diseases.
34
35
36
37

38 14 An example of one of the primary ways AI is being utilized within physiotherapy is
39
40 15 through the development of wearable devices and sensors. These tools track patient
41
42 16 physiological data and provide real-time feedback allowing clinicians such as
43
44 17 physiotherapists to make more informed decisions and adjust treatment plans as needed
45
46 18 (Machado-Jaimes et al., 2022). There is the potential that AI algorithms can analyse data
47
48 19 from these devices to predict patient outcomes and personalize treatment plans. This way,
49
50 20 AI is able to apply objective measurements in a profession that could often be considered
51
52 21 largely subjective. Moving forwards, AI technology has the potential to reduce the time and
53
54 22 effort required for certain tasks, freeing up physiotherapists and other MDT members to
55
56 23 focus on more complex cases.
57
58
59
60

1
2
3 24 Another domain within clinical education that AI may have an impact on is the use of
4
5
6 25 virtual and augmented reality (VR and AR) simulations. These simulations may provide a
7
8 26 safe and controlled environment for healthcare students and workers to practice and
9
10
11 27 develop their skills. Additionally, VR and AR simulations can be used to recreate real-life
12
13 28 scenarios, allowing practitioners to better understand the physical and environmental
14
15 29 challenges that their patients face.

16
17
18 30 While AI has the potential to greatly enhance clinical education and practice, there
19
20
21 31 are also a number of challenges that must be addressed. Key concerns include the need for
22
23 32 effective data management and privacy protection. Additionally, there is a need for
24
25
26 33 clinicians to be trained and equipped with the necessary technical skills to effectively use AI
27
28 34 tools.

29
30
31 35 Furthermore, there is the risk of deskilling, where healthcare workers may lose
32
33 36 important skills and expertise due to the over-reliance on AI algorithms and technology.
34
35
36 37 This could be compounded by poor understanding, overconfidence, and a lack of necessary
37
38 38 vigilance of the automated clinical workflow (Panesar et al., 2020). This can be particularly
39
40 39 concerning in areas such as clinical decision-making and patient interaction, which require
41
42 40 human skills such as empathy, emotional intelligence, and critical thinking. To mitigate the
43
44 41 risk of deskilling in healthcare, it is important for healthcare organizations to provide
45
46 42 ongoing training and support for their employees to coexist with AI tools.

47
48
49
50
51 43 Educational institutions providing preregistration training should provide a formal
52
53 44 response to the introduction of novel AI technologies in support of their students learning.
54
55 45 There are challenges with regards to accurately assessing the individual's ability to learn,
56
57 46 collate, retain and implement new information, where AI could have been used to perform
58
59
60

1
2
3 47 assessments design to test this process. Those working in academia must be vigilant to
4
5 48 ensure that content generated is accurate, as indicated by this piece, as a minority of the
6
7
8 49 references generated were either incomplete or incorrect.
9

10
11 50 While the answer may be to lean onto the use of Objective Structured Clinical
12
13 51 Examinations (OSCEs); OSCEs presents its own challenges. OSCEs may not accurately reflect
14
15
16 52 the complex and dynamic nature of real-life clinical situations (Gormley, 2011). Additionally,
17
18 53 OSCEs are time-consuming and expensive to administer and may also put added pressure on
19
20
21 54 students, potentially leading to stress and anxiety. Similarly, it does not teach students key
22
23 55 skills in gathering and generating knowledge.
24
25

26 56 While one may be concerned with student use of AI, there is also a risk that AI-
27
28
29 57 powered education systems could perpetuate biases and existing societal inequalities. For
30
31 58 example, AI algorithms used to grade student essays or assess their performance may be
32
33
34 59 trained on biased data, leading to unfair or inaccurate assessments.
35
36

37 60 Another risk of AI in education is the potential for increased inequality. While AI has
38
39 61 the potential to provide access to education for people in remote or underserved
40
41
42 62 communities, it also has the potential to widen existing disparities by favouring those who
43
44 63 have access to technology and digital literacy skills. This problem may extend towards the
45
46
47 64 inequalities widely seen within healthcare.
48
49

50 65 In conclusion, the integration of AI into interprofessional education has the potential
51
52 66 to significantly enhance the training and practice of those working in the clinical field.
53
54
55 67 However, it is important to approach the development and use of AI with caution. Clinicians
56
57 68 and academics alike need to consider issues such as inequality, bias, deskilling and academic
58
59
60

1
2
3 69 integrity. Training in the use of AI tools, and maintenance of key clinical skills, is
4
5
6 70 fundamental for a world where AI is becoming an inevitability.

44
45 105 This letter to the editor has been written using the assistance of artificial intelligence by
46
47 106 ChatGPT (OpenAI). Key words and ideas were inputted into the software, which generated
48
49 107 fully written paragraphs detailing current evidence alongside arguments for and against the
50
51 108 use of AI in healthcare education. A review of structure, literature and content was then
52
53 109 performed by the authors to ensure validity and reliability, editing where required.
